

# Adaptive and Generative Music in Games

Sonic College 2025  
Jakob Schmid

# Overview

- Early Game Audio Hardware
- Adaptive and Generative Music in Games
- Combining Approaches
- Plugin Platforms
- Example Unity Plugins

# Early Game Audio Hardware

# Hardware synthesizers

- 1970s to mid 1980s: hardware-based realtime synthesis
- Hardware synthesizer-based hardware platforms
  - Arcade machines (1970s and forward)
  - Atari 2600 (1979)
  - ZX Spectrum (1982)
  - Commodore 64 (1982)

*Marble Madness*

*ZX Spectrum*

*Commodore 64*

*Atari 2600*

# From Synthesizers to Samplers

- Sound chips with fixed number of DCOs controlled from CPU
- Possible to play samples using clever tricks
- Sample playback hardware become the norm in 1985 and forward
- This mirrored the general evolution in music technology

*Amiga 1000 (1985),  
sample-based audio hardware*

# Commodore 64 SID Chip

- 3 DCOs
- Waveforms: pulse, triangle, saw, noise
- Ring modulation, oscillator sync
- Multimode filter: low-, high-, bandpass (6dB/12dB rolloff)
- 3 Envelope generators

# Yamaha YM2151

- FM synthesis, 4 operators
- 8 channel polyphony
- Used in many arcade games by Atari, SEGA, and Konami
- See also

<https://vgmrips.net/packs/chip/ym2151>

# ZX Spectrum Speaker

- 1 tone generator
- 1-bit volume, on or off

# Summary

- Hardware based realtime synthesis was the norm until mid 1980s
- From around 1985, sample-based hardware started to become the norm
- Early audio hardware ranged from 1-bit tone generators to subtractive synthesis and FM synthesis.

# Adaptive and Generative Music in Games

# How would you define these terms?

- Adaptive game music
- Generative game music.

## Adaptive Music

Music that changes as a result of a change in game state

### Key and Tempo changes

Ex.: Space Invaders

### Vertical Remixing

Dynamically changing instrumentation based on game state

Ex.: Super Mario World (Yoshi bongos)

### Horizontal Re-sequencing

#### Hard re-sequencing

Ex.: Xenon (pinball)

#### Re-sequencing with transitions

Ex.: Monkey Island 2

### Synchronized Scoring

Syncing Music to Picture also known as 'Mickey Mousing'

Ex.: Dig Dug

## Generative Music

Music that is generated at runtime. Can be adaptive or non-adaptive

### Interactive Music

Music generated directly from player input

Ex.: Tetris Effect

### Note-generative music

Individual notes are generated, e.g. MIDI messages

Ex.: Spore

### Realtime synthesis

Sound signal is generated at runtime

Ex.: Chronos (1-bit music)

## Adaptive Music

Music that changes as a result of a change in game state

### Key and Tempo changes

Ex.: Space Invaders

### Vertical Remixing

Dynamically changing instrumentation based on game state

Ex.: Super Mario World (Yoshi bongos)

### Horizontal Re-sequencing

#### Hard re-sequencing

Ex.: Xenon (pinball)

#### Re-sequencing with transitions

Ex.: Monkey Island 2

### Synchronized Scoring

Syncing Music to Picture also known as 'Mickey Mousing'

Ex.: Dig Dug

## Generative Music

Music that is generated at runtime. Can be adaptive or non-adaptive

### Interactive Music

Music generated directly from player input

Ex.: Tetris Effect

### Note-generative music

Individual notes are generated, e.g. MIDI messages

Ex.: Spore

### Realtime synthesis

Sound signal is generated at runtime

Ex.: Chronos (1-bit music)

# Space Invaders

- Arcade 1978
- Plays descending notes

C#1, B0, A0, G#0

- Accelerates from 69 BPM to 690 BPM as enemies are killed and move faster
- Adaptive using tempo change

# Dragon Warrior

- NES 1986
- Dungeon music changes key with dungeon level
- Helps player finding their way around?
- Adaptive using key change

# Super Mario World

- SNES 1990
- When you ride Yoshi, a bongo track is added to the music
- Vertical remixing

# Xenon

- Pinball 1980
- Switches between music loops and voice samples
- Designed and composed by Suzanne Ciani
- Hard horizontal re-sequencing

# iMUSE

- DOS 1991
- Interactive Music Streaming Engine
- LucasArts
- First used in 'Monkey Island 2: LeChuck's Revenge', DOS 1991
- Adaptive MIDI music with seamless transitions and feedback to gameplay
- Horizontal re-sequencing with transitions

# Dig Dug

- Arcade 1982
- Each step of your little guy is accompanied by a musical note
- ~ Mickey Mousing
- Synchronized scoring

## Adaptive Music

Music that changes as a result of a change in game state

### Key and Tempo changes

Ex.: Space Invaders

### Vertical Remixing

Dynamically changing instrumentation based on game state

Ex.: Super Mario World (Yoshi bongos)

### Horizontal Re-sequencing

#### Hard re-sequencing

Ex.: Xenon (pinball)

#### Re-sequencing with transitions

Ex.: Monkey Island 2

### Synchronized Scoring

Syncing Music to Picture also known as 'Mickey Mousing'

Ex.: Dig Dug

## Generative Music

Music that is generated at runtime. Can be adaptive or non-adaptive

### Interactive Music

Music generated directly from player input

Ex.: Tetris Effect

### Note-generative music

Individual notes are generated, e.g. MIDI messages

Ex.: Spore

### Realtime synthesis

Sound signal is generated at runtime

Ex.: Chronos (1-bit music)

# Otocky

- NES 1987
- Music generated by gameplay elements
- Hardware NES synth, 5 channels + sample playback
- Interactive music

# Electroplankton

- NDS 2005
- Generative music toy
- Uses collisions from 2D physics model to generate notes
- Note-generative

# Rise of the Tomb Raider

- PS4, Xbox One 2015
- Dynamic Percussion System for battle sequences
- Generated drum sequence that reacts to battle intensity level
- Note-generative

# Spore

- Windows 2008
- Editors (such as creature editor) generates notes in realtime based on choices (e.g. meat-eater or vegetarian)
- Most sounds are samples, some realtime synthesized
- Kent Jolly and Brian Eno
- Uses PureData
- Note-generative

# FRACT OSC

- Windows 2014
- First-person puzzle game where you construct a realtime-synthesized piece of music
- Uses PureData
- Realtime synthesis

# Combining Approaches

# Tetris Effect

- PS4, Xbox One 2018
- Quantizes player input to beats and triggers samples in time with music
- Samples are pitched to reflect key changes in music
- Each level is an music toy that the player can play with

# Tetris Effect: Music System

- Hybrid interactive/adaptive music
- Interactive: player input is quantized and plays notes
- Vertical remixing (possibly): according to level progress
- Horizontal re-sequencing with transitions: big transitions according to level progress

# 140

- Windows 2013
- Vertical remixing used to dynamically change music with player movement
- Hard horizontal re-sequencing used when delivering a new key

# COCOON

- Windows/consoles 2023
- Vignettes: hard horizontal re-sequencing using FMOD Studio
- Ambient: realtime generated using custom FMOD synthesizer plugins
- Boss fights: combines all techniques
- Ambient adapts to player position
- Boss fights adapts to game state

# COCOON: Music System

- Hybrid adaptive/generative music
- Hard horizontal re-sequencing for vignettes
- Realtime generated ambient
- Adapts to player position and game state

# Rytmos

- Switch, Windows 2023
- Music by Niels Böttcher
- Note-adaptive sequencing based on puzzle state
- Uses scales carefully selected to fit music genre
- A few realtime Unity Native Audio Plugin effects by me

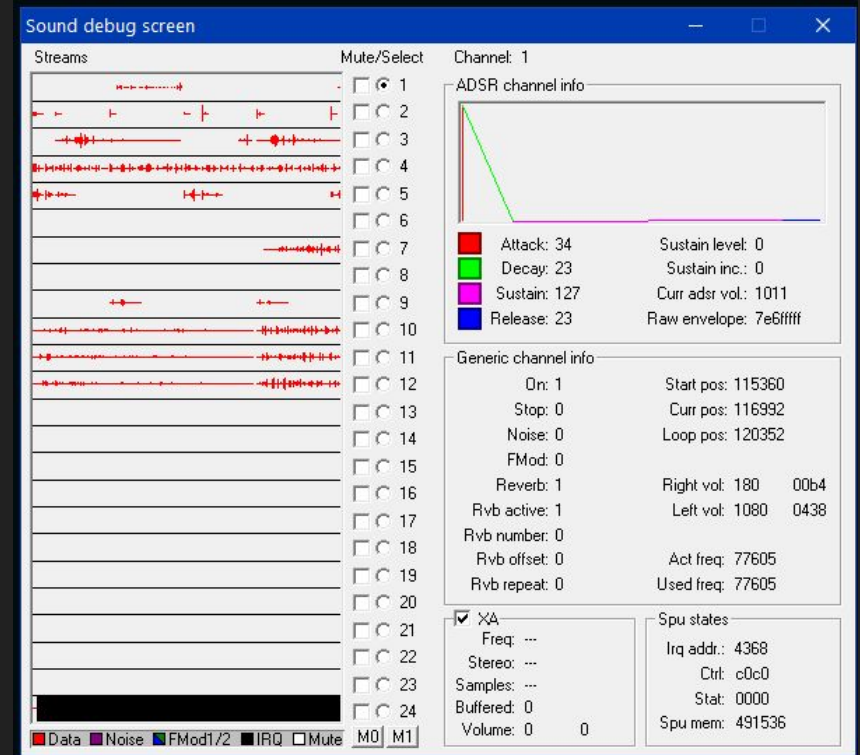

# Mid-late 1990s

- Sample-based audio hardware
- Cheaper memory makes sampled sound more useful

# PlayStation Audio Hardware

- 24 channels, 16-bit, 44.1 KHz
- Each channel:
  - looping
  - pitch
  - amplitude envelope
  - panning
  - effect send on/off
- 1 stereo streaming CD track
- 1 configurable delay / reverb effect
- 512 KB audio memory

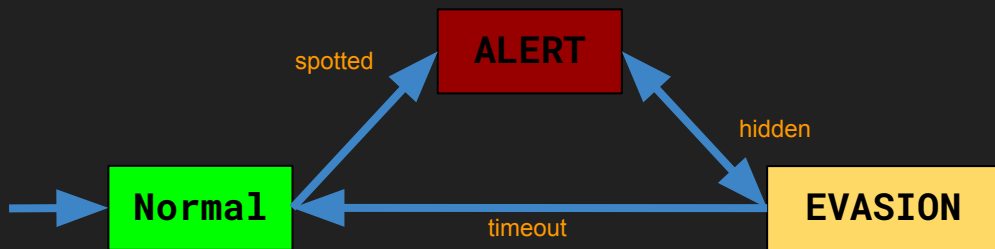

# Metal Gear Solid

- PlayStation 1998
- Stealth action game
- Directed by Hideo Kojima

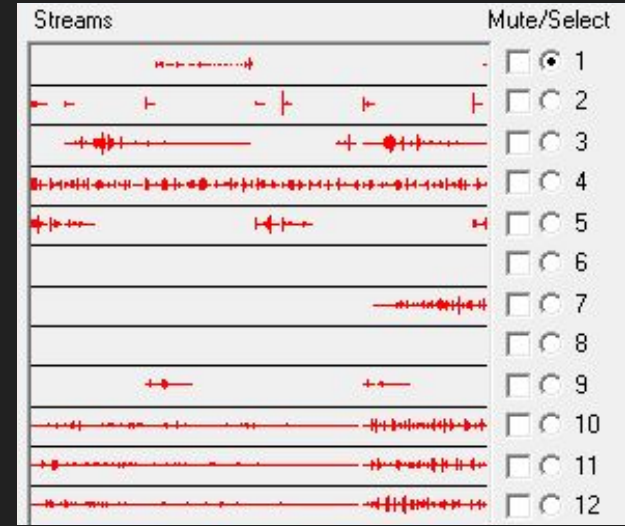

# Metal Gear Solid: Game States

- Normal >> ALERT: immediately when spotted
- ALERT >> EVASION: automatic when hidden for a while
- EVASION >> Normal: automatic when hidden for a while

# Metal Gear Solid: Music System

- 12-track sample-based sequencer
- Follows game states:

- Normal >> ALERT: immediately play **!** sound (diminished chord), key and tempo change, exciting music
- EVASION: some tracks fade out and tempo slows down
- EVASION >> Normal: Switch to calm background music

# Metal Gear Solid: Music System

- Hybrid adaptive music
- Horizontal re-sequencing (hard change for ALERT state, otherwise gradual transitions)
- Vertical remixing (tracks are faded gradually after ALERT)

# Summary

- Combining approaches is powerful
- Tetris Effect, Metal Gear Solid, 140, COCOON, Rytmos

# Audio Plugins

# MIDI-like Sequencing

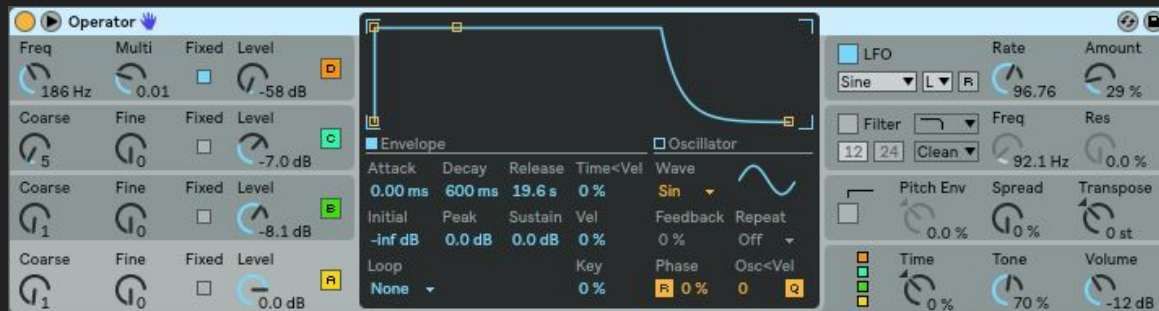

- Sequencing of samples or real-time synthesis
- Key changes
- Removing notes
- Procedural / generative music

Cubase (1989)

# Real-time Synthesis

- Parameter changes controlled from game
- Subtle changes in timbre accompany game events
- Variations in timbre retain player interest even though sequence repeats

*Ableton Live 10: Operator*

# Modern Realtime Synthesis

- Implemented as audio plugins in sound engines
- Normally rendered on CPU, not in dedicated hardware

*FMOD Studio plugin*

# Audio Plugin Types

- FMOD Studio Plugin
- Wwise Sound Engine Effect Plugin
- Unity Native Audio Plugin
- VST 2.4
- Audio Units (Core Audio)

# What is an Audio Plugin?

- A piece of code that outputs samples to an audio buffer
- Some wrapping that enables parameters and stuff

# Audio Buffers

An audio buffer is a block of memory containing samples:

s0 s1 s2 s3 s4 s5 s6 s7

# Rendering to Audio Buffer

An audio buffer is a block of memory containing samples:

```
buffer -> S0 S1 S2 S3 S4 S5 S6 S7  
float [] buffer = new float[SAMPLE_COUNT];
```

Rendering code fills buffer with samples:

```
void process(float [] output, int length)  
{  
    for(int s = 0; s < length; ++s)  
        output[s] = COMPUTE_SAMPLE;  
}
```

# Stereo Audio Buffer

An interleaved stereo audio buffer:

L0 R0 L1 R1 L2 R2 L3 R3

# Rendering to Stereo Audio Buffer

An interleaved stereo audio buffer:

L0 R0 L1 R1 L2 R2 L3 R3

Rendering code:

```
float [] buf = new float[SAMPLE_COUNT * 2];
void process(float [] output, int length) {
    int idx = 0;
    for(int s = 0; s < length; ++s) {
        output[idx++] = COMPUTE LEFT SAMPLE;
        output[idx++] = COMPUTE RIGHT SAMPLE;
    }
}
```

# Synths vs. Effects

Implemented exactly the same way, except:

- Effects receive audio input
- Synths receive note and parameter input

# Effect Rendering

Example code for a mono effect:

```
float [] input = new float[SAMPLE_COUNT];  
float [] output = new float[SAMPLE_COUNT];  
  
void process(float [] input, float [] output, int length)  
{  
    for(int s = 0; s < length; ++s)  
        output[s] = COMPUTE SAMPLE FROM input[s];  
}
```

# Summary

- Realtime synthesis is done using software audio plugins
- Different audio software have different plugin types
- Audio plugins output samples to audio buffer
- Synths and effects are very similar, except for their input

# Plugin Platforms

}
```

# VST 2.4

```
void VstXSynth::processReplacing(  
    float** inputs, float** outputs, // input / output - buffers  
    VstInt32 sample_frames )        // buffer size  
{  
    // not interleaved, left and right are separate  
    float* buf_left  = outputs[0];  
    float* buf_right = outputs[1];  
    RENDER sample_frames SAMPLES TO buf_left AND buf_right  
}
```

# Summary

- Same code can easily be adapted for different plugin platforms
- FMOD Studio, Unity Native Audio Plugins, and VST 2.4 have similar interfaces

# Example Unity Plugins

# Unity C# Plugin Structure

```
class MySynthBehaviour : MonoBehaviour
{
    [...]
    void OnAudioFilterRead(float[] data, int channels)
    {
        int length = data.Length / channels;
        int idx = 0;
        for (int s = 0; s < length; ++s)
        {
            data[idx++] = COMPUTE LEFT SAMPLE
            data[idx++] = COMPUTE RIGHT SAMPLE
        }
    }
}
```

# Sine Synth

```
float phase = 0.0f;
float freq = 200.0f;
const float secondsPerSample = 1.0f / 48000.0f;
void OnAudioFilterRead(float[] data, int channels)
{
    int length = data.Length / channels;
    int idx = 0;
    for (int s = 0; s < length; ++s)
    {
        float out = Mathf.Sin(phase * Mathf.PI * 2.0f);
        data[idx++] = out; // left channel
        data[idx++] = out; // right channel
        phase += freq * secondsPerSample;
        if(phase > 1.0f) phase = 0.0f;
    }
}
```

# Distortion Effect (from 140)

```
int D = 0; // downsample factor
void OnAudioFilterRead(float[] data, int channels)
{
    if(D > 1)
    {
        for (int s = 0; s < data.Length; s+=2)
        {
            data[s]    = data[s / D * D]; // left channel
            data[s+1] = data[s / D * D + 1]; // right channel
        }
    }
}
```

# Music Code Example

```
class SpookyBeat : MonoBehaviour
{
    float s = 0;

    void OnAudioFilterRead(float[] data, int channels)
    {
        int smp = 0, length = data.Length;

        while (smp < length)
        {
            s = ++s % 288000;
            float p = (s / 288000) * 0.5f;
            float pBar = (p * 8) % 1;
            float hhAmp = (0.13f + ((pBar * 4) % 1) * -0.09f);

            // mixer
            float output = BD(pBar * 8 / 3) * 0.8f
                + HH((pBar * 8) % 1) * hhAmp
                + bass(p) * 0.2f + bass(p - 0.024f) * 0.1f;

            for (int c = 0; c < channels; ++c)
                data[smp++] = output;
        }
    }
}
```

```
// Bassdrum: sine with pitch and amplitude envelope
float BD(float p)
{
    float env = Mathf.Clamp01(0.1f - (p % 1f)) * 10f;
    float fr = 30f + env * 100f;
    float ph = (p % 1f) * fr;
    return Mathf.Sin((ph % 1f) * 6.28f) * env;
}

// Hihat: noise with amplitude envelope
float HH(float p)
{
    return Mathf.PerlinNoise(p * 2000, 0f) * (1f - p);
}

// Spooky bass: FM synth
float bass(float p)
{
    return Mathf.Sin(p * 4000 + Mathf.Sin(p * 4000
        + Mathf.Sin(p * 3.28f) * 1111))
        * Mathf.Sin(((p * 64 / 3f) % 1) * 3.141f);
}
}
```

# Summary

- Unity audio plugins can be written in C#
- Unity audio plugins have the same structure as other audio plugins
- Example synth and distortion effect
- Example music code

# VST Plugins or Audio Units in Games?

**Jakob Schmid**

@jakobschmid

@SteinbergMedia VST license question: Can I sell a game that contains a VST 2.4 host and VST 2.4 plugins? Does it require a license from you guys?

**Steinberg** @SteinbergMedia · 20 Aug 2018

Replying to @jakobschmid

Hello, are these VST Plug-ins that have been developed by you? As long as you don't use the VST name or our VST logo, that should be fine.

# VST Plugins or Audio Units in Games?

If plugin is open source or homemade:

- Relatively easy to adapt to game audio plugin

# VST Plugins or Audio Units in Games?

Most interesting VST/AU plugins are *not* open source.

Technically they could still work in a game, however:

- Illegal distribution: Most VST/AU plugins licensing models do not allow for redistributing to potentially millions of users in a game.
- Limited platforms: Most VST/AU plugins are available in binary form for Windows and Mac OS X, but not for Android, iOS, PS4, Xbox One, etc. so would only work on computers.

# VST Plugins or Audio Units in Games?

- Possible.
- Not practical!

# Audio Plugin Interface

- Audio system calls our code with buffer
- Our code writes samples to buffer
- Audio hardware outputs buffer to speaker

# Wwise Sound Engine Effect Plugin

```
void IAkOutOfPlaceEffectPlugin::Execute(  
    AkAudioBuffer * io_pInBuffer,    // input buffer  
    AkUInt32      in_uInOffset,     // offset  
    AkAudioBuffer * io_pOutBuffer ) // output buffer  
{  
    float *buf = io_pOutBuffer->GetChannel(0);  
    RENDER [FIXME - how many samples?] TO buf  
}
```

# Dead Space

- Xbox 360, PS3 2008
- Uses traditional dynamic orchestral music
- Atonal orchestral stings are triggered by the player seeing a mutant for the first time

# DEMO: Example Plugins in Action

- Standalone
- Unity Native Audio Plugin
- FMOD Studio
- VST 2.4

# Atari 2600 TIA Chip

- Integrated graphics and sound
- 2 DCOs pulse waveform
- 32 pitch values (not enough)
- 4 bit volume
